Clinical Research Collaborations in North Dakota

Stephen Wonderlich Ph.D.
Vice-President for Research, Sanford Health-Fargo
Chester Fritz Distinguished Professor
University of North Dakota School of Medicine and Health Sciences

February 17th, 2021
Objectives

2. Overview of Collaborative Center of Biomedical Research Excellence (COBRE) Grant Application (2020 – 2021)
Eating Disorder Treatment Development

• Eating disorders represent one of the most (if not the most) lethal psychiatric disorders
  – Anorexia nervosa
  – Bulimia nervosa
  – Binge eating disorder

• Eating disorder treatments are moderately effective, intensive (hospital), and lengthy
Local Basic Behavioral Science Collaboration (since 1998)

• Twenty years ago we needed a better understanding of the nature of EDs in real time and real world (what symptoms, when, under what conditions)

• UNDSOM, NDSU, Meritcare/Sanford personnel developed technology-based behavioral assessment system
  – Behaviors (symptoms)
  – Location
  – Stress
  – Cognition
  – Emotion
  – Eating

(Funded by NIMH MH059674, MH059674-5)
This was “cool” in 1998!
Real-Time Assessment In the Natural Environment (ReTAINE)

ReTAINE is a highly effective tool for research organizations needing a secure system for collecting data from research participants in their natural environment.

ReTAINE stands for Real Time Assessment In the Natural Environment. The researchers at the Neuropsychiatric Research Institute in Fargo, North Dakota created this web-based system that allows researchers and clinicians to gather important information from individuals in their natural environment.

ReTAINE can be used to design customized assessments, can automatically signal participants to complete those assessments based upon individualized schedules, and it can collect and manage the data participants provide using their smartphones, tablets or personal computers.

ReTAINE is easy to use, economical and secure.

CONTACT NRI TODAY for more information or to schedule a demonstration.
We learned a lot in these studies.
One example...
Emotional States and Symptoms
How to bring these findings to the clinic?

The strength of clinicians and scientists collaborating.
A randomized controlled comparison of integrative cognitive-affective therapy (ICAT) and enhanced cognitive-behavioral therapy (CBT-E) for bulimia nervosa

S. A. Wonderlich1, C. B. Peterson2, R. D. Crosby1, T. L. Smith3, M. H. Klein3, J. E. Mitchell1 and S. J. Crow2

1Neuropsychiatric Research Institute/Department of Clinical Neuroscience, University of North Dakota School of Medicine and Health Sciences, Fargo, ND, USA
2Department of Psychiatry, University of Minnesota, Minneapolis, MN, USA
3Department of Psychiatry, University of Wisconsin, Madison, WI, USA

(Funded by NIMH MH098995, MH077571)
But how do we disseminate and implement?
2021 ICAT Learning Collaborative Marketing Plan

Learning Collaborative Presenters:
Stephen Wonderlich, PhD, FAED
Carol Peterson, PhD, FAED
Importantly, these collaborative projects can lead to bigger collaborative projects.

Summary

• Local institutions have effectively collaborated on eating disorder research
• The research program has clinical utility and relevance
• In our experience health systems and universities are good collaborators
